

TASK INSTRUCTIONS

Full Stack Developer (MERN)

Section	Details
Task Duration	The candidate will have 24 hours to complete the assigned task.
Submission Deadline	25 September 2026 (Friday) by 7:00 PM
Task Start Time	The 24-hour duration will commence from the time the task is shared with the candidate.
Submission	The complete task must be submitted to the HR Department before the specified deadline.
Live Website URL	Please share the Live Website URL after successfully deploying the application.
Admin Panel URL	Please share the Admin Panel URL along with the submission.
Admin Login Credentials	Please provide the Admin Login ID and Password required to access the admin panel.
GitHub Repository	Please share the GitHub Repository Link , if applicable. The repository should contain the complete source code and relevant project files.
Deployment	The completed website must be deployed and accessible through a live URL. Candidates may use any suitable hosting platform available to them.
Project Functionality	All features and requirements specified in the task should be implemented and functional in the deployed application.
Code Quality	The project should follow proper coding standards, maintain a clean project structure, and demonstrate appropriate validation, error handling, security practices, and responsiveness.
Environment Variables & Credentials	Sensitive information such as API keys, database credentials, passwords, and other secrets must not be exposed publicly in the GitHub repository. Use environment variables or the hosting platform's environment-variable settings.
Queries & Clarifications	In case of any queries or clarification regarding the task, please coordinate with the HR Department within the given task duration.
Final Submission	Please ensure that all required links, credentials, source code, and other submission details are shared with HR before the submission deadline .

School Website: News & Events and Admissions

Design	https://design-mockup.addev.in/manthan/manthan-noida-option-1
Stack	Next.js (App Router), Node.js with Express, MongoDB Atlas with Mongoose
Structure	One repository with <code>/web</code> (Next.js) and <code>/api</code> (Express). All data must come from the Express API. Do not use Next.js API routes as the backend.

The school wants to publish news and events from an admin panel and collect admission enquiries on the website. Every enquiry must also reach the school's CRM.

Must have

Website (Next.js)

1. Build only the News & Events and Admission Enquiry sections from the mockup.
2. The homepage shows the latest 3 published items. A "View all" page lists published items with pagination. Each item opens at `/news-events/[slug]` with its own page title and meta description.
3. Load data for these pages on the server, not in the browser.
4. Enquiry form with parent name, student name, class applying for, mobile, email (optional) and message (optional). Submit without a page reload; show errors under each field and a success message.

API (Express and MongoDB)

5. Public endpoints to list published items (pagination, newest first) and to get one item by slug.
6. Validate enquiries on the server. Mobile must be a 10-digit Indian number starting with 6, 7, 8 or 9. Return errors as JSON with the correct status code.
7. If the same mobile number enquires for the same class within 24 hours, do not save it again. Return the message "We have already received your enquiry."
8. CRM push: after saving, POST the enquiry as JSON to the URL in `CRM_WEBHOOK_URL` (use a free webhook.site URL) with a 5-second timeout. The form must still succeed if the CRM is slow or down. Save the result on the enquiry as Sent or Failed.

Admin panel (under `/admin`, plain UI is fine)

9. Admin login with a bcrypt-hashed password and JWT. Protect the admin pages and endpoints. Create the admin user with a seed script.
10. News & Events: list, add, edit and delete. Fields: title, category (News, Event, Achievement), date, image (JPG, PNG or WebP, max 2 MB), short description, content and published (yes/no). Create the slug from the title and keep it unique.
11. Enquiries: newest first with pagination, filter by status, change status (New, Contacted, Closed) and show the CRM result.

Deployment

12. Deploy the website and API on Hostinger, with MongoDB Atlas as the live database and all secrets in environment variables. Add at least 6 news and event items on the live site.

Good to have

- Category filter on the "View all" page.
- Email alert to the admissions team for each new enquiry.
- Retry failed CRM pushes from the admin panel.
- Rate limit on the enquiry endpoint (5 requests per minute per IP).
- Cache the public pages and refresh them within 60 seconds of a change in the admin panel.
